**Eredi Caimi Srl offers its services as a single supplier capable of satisfying the packaging requirements of any product, even fragile, heavy or irregularly shaped ones.**

The Varese-based concern is able to guarantee: diversified and complementary production; its own assisted sales service; speedy and flexible distribution; high quality articles, all certified and at costs competitive by European standards.

These are just a few of the characteristics that garner appreciation for the products and services of Eredi Caimi, a company that

guarantees for its customers a series of complementary and indispensable services, including:

- deliveries on time and rationally spaced;
- technical upgrades for any packaging problem;
- consulting for deliveries management and storage optimization.

The concern's production includes:

- corrugated cardboard packaging;
- polystyrene and polypropylene packaging;
- palletized packaging;
- external protection;
- pack and container filling
- article setting and strapping.

### Lateral profiles

This innovative system has a base made from synthetic material on which the cardboard packagings are

placed.

The bases (made from injection moulded polypropylene copolymer), in spite of their contained bulk of 900 g per unit, can load up to 3100 kg. The single elements are formed by a mount, in which the forks of the forklift are inserted, and a lateral support that facilitates its positioning at the four sides of the group of boxes to be palletized.

#### Cardboard pallets

Made entirely out of corrugated cardboard, these pallets are 100% recyclable and lightweight, but with high load capacity and requiring no treatment for export.

They can be used for export to countries in which delivery on wood pallet is illegal; they require no fumigation treatments or phytosanitary certificates, and have been tested for stacking up to 1000 kg.

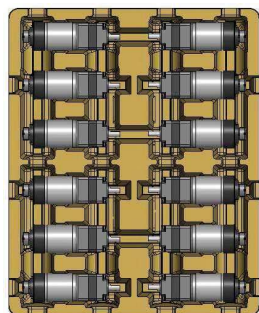

#### Thermal covers

are suitable for protecting any kind of perishable good, especially in the pharmaceutical and food sectors. Thermal covers can be used to cover europallets, air containers, trolleys and containers.

#### Pulp Pack

This is a new wood pulp packaging solution proposed by Eredi Caimi that employs recycled paper and ecological additives as raw materials. The end result is a product that is recycled, recyclable and biodegradable.

#### Internal protection

Various solutions are available: air bubble impact protection material made from expanded Polifrene, laminates, corrugated cardboard, padding paper, tar paper, crepe paper, wax paper, anti-corrosion paper and tubular netting.
