

Retrofit Electrical Solutions for Domestic & Light Commercial Installations

- Voltage Optimisation. Save 9-13% off your electrical bill.

UK voltage is supplied at around 240Volts, whilst electrical equipment works most efficiently at around 220Volts. This over-supply of energy not only costs you money, it substantially reduces the lifespan of your domestic appliances.

Voltage optimisers reduce the voltage level to your property by a transformer. The unit is installed between the energy supplier's mains feed and the domestic supply circuit. This gives you cheaper electricity, cuts carbon emissions and helps prolong the life of appliances.

The cost of 60A Voltage Optimisation Device with installation is **£650**
(Cost of property Inspection & Testing and Electrical Installation Certificate are included)

- Domestic Boiler Management Device. Reduce the annual cost of running your boiler by 20%*.

The domestic boiler manager is compatible with mains gas, LPG and oil boiler, using a unique variable thermal response program and electronic sensors to intelligently manage boilers, maximising efficiency while ensuring the demand on the heating system is met in full.

Key benefits:

- Reduces energy usage and carbon footprint.
- Save money without compromising on the provision of your heating and hot water
- Compact and unobtrusive design
- Typical payback within 2-3 years

The cost with installation is **£650**
(Minor Works certificate is included)

* subject to boiler usage pattern

- Distribution Board (Fusebox) Replacement

If your distribution board, commonly known as a "fuse box", has no RCD protection, lack of spare ways or is damaged then you might consider replacement. The distribution board replacement also includes inspection & testing of the installation and an Electrical Installation Certificate on completion.

The cost of the 6-10 circuit Distribution Board Replacement is **£400** (Cost of property Inspection & Testing and Electrical Installation Certificate are included)**
