IBC Bund Spill Pallet - User Health & Safety Instructions for SG101, 102, 104, 105, 109, 110

The IBC Bund will give many years of service by just following the simple guidelines below.

Siting the IBC Bund

The IBC Bund should be sited and fully supported on a flat uniform level surface of a sufficiently strong and stable nature, and should be clean of stones and any other objects. A bed of soft sand cement mix can be used if the site is uneven.

Loading the IBC Spill Containment Bundstand

Forklift users should be instructed to lower the IBC unit as carefully and as level as possible on the Bund.

The IBC unit must sit on the recessed pads, avoid lowering onto elevated surfaces. The forks should be withdrawn free of snagging the IBC Bund rim or any part of the IBC unit.

Forklift users should be made aware that the single IBC Bund is not square and the IBC unit should be loaded correctly. The IBC unit nozzle should face toward the narrowest side. IBC Bunds with a drain off bucket facility cannot be loaded from the bucket side.

The IBC unit should not be loaded onto the Bund while the IBC Bund is on a pallet.

Spillages

In the event of a spill and in harmony with good housekeeping, cleanups should occur immediately and any residual liquid neutralised. However, data sheets should be consulted and the health and safety officer or responsible person should supervise all cleanups. Waste should be disposed of in accord with the manufacturers direction.

The units are designed/supplied for secondary containment of spillage, and not for primary containment unless otherwise agreed in writing.

Use

The IBC Bund is designed to cope with a variety of environments and is suitable for 95% of all liquids to be stored. Please refer to our chemical resistance chart showing the range of liquids that can be safely banded:

<http://www.suigeneris.co.uk/pdfs/Spill-Containment-Chemical-Resistance-Charts.pdf>

When drawing from the IBC unit directly into a container, sensible practices should be followed such as not overfilling the container, not leaving the container whilst being filled, the wearing of appropriate gloves, etc. The filled container should not be removed from the IBC Bund without first making sure the IBC valve is turned off and not leaking fluid.

Storage

Thoroughly clean and store on a flat surface.

Moving the IBC Spill Containment Bund

The IBC Bund can be lifted quite comfortably by two healthy personnel. It is recommended that when moving the location of the IBC Bund it is manhandled onto a pallet and moved by forklift. If relocating please refer to 'Siting the IBC Bund' (top left).

When manhandling the IBC Bund sensible lifting practices should be employed:

- Do not:-
- Drag the IBC Bund
 - Forklift without a pallet

Under no circumstances should any IBC Bund be moved while accommodating an IBC unit.

SG105
Spill containment for

Spill Containment

IBC Bund Spill Pallet - User Health & Safety Instructions for SG106, SG107, SG108

The IBC Bund will give many years of service by just following the simple guidelines below.

Siting the IBC Bund

The IBC Bund should be sited and fully supported on a flat uniform level surface of a sufficiently strong and stable nature, and should be clean of stones and any other objects.

Loading the IBC Spill Containment Bundstand

Forklift users should be instructed to lower the IBC unit as carefully and as level as possible on the Bund, centrally over the grating supports.

The forks should be withdrawn free of snagging the IBC Bund rim or any part of the IBC unit.

The IBC unit nozzle should face toward the front.

Spillages

In the event of a spill and in harmony with good housekeeping, cleanups should occur immediately and any residual liquid neutralised. However, data sheets should be consulted and the Health and Safety Officer or responsible person should supervise all cleanups. Waste should be disposed of in accord with the manufacturers direction.

The units are designed/supplied for secondary containment of spillage, and not for primary containment unless otherwise agreed in writing.

Use

The IBC Bund is designed to cope with a variety of environments and is suitable for 95% of all liquids to be stored. Please refer to our chemical resistance chart showing the range of liquids that can be safely banded:

<http://www.suigeneris.co.uk/pdfs/Spill-Containment-Chemical-Resistance-Charts.pdf>

SG108 - Bund up to 12 x 1000 litre IBCs.

SG107 - Bund up to 9 x 1000 litre IBCs.

Custom Built Bunds and Spill Trays

IBC Bund with removable side.

Tailor made to your exact requirements, our custom built bunds are more economical than you might think. Your bund will be manufactured in a resin finish to suit your specific liquid storage requirements providing you with a cost effective long term solution to your bunding needs.

Why buy a Sui Generis Custom Built Bund or Spill Tray?

Made to suit your exact needs.
Tough reinforced composite construction.
Broad range chemical compatibility.
Retains long term structural integrity.
Lightweight.
Easy to install.

Benefits:

Protects the workplace, environment and personnel.
Maintenance free.

Compliance:

Compliant with the 110% bund regulations.
No taps or drainage points to compromise the bund area.

As the UK manufacturer we offer quality products at competitive prices. Should you receive a more competitive like for like quotation, we guarantee to beat it.

To get a quotation for your exact requirements call: 01206 798 798

All prices exclude VAT. Delivery extra.
Usual delivery within 2 weeks of receipt of order.
